Deficiencias más usuales provocadas por la válvula reguladora de presión.

Filtros para aceite lubricante con presión excesiva.

Todos los fabricantes de filtros han recibido alguna vez un filtro devuelto por un cliente con una sobrepresión excesiva. Con frecuencia, el filtro deformado es la única indicación que tiene el dueño del automóvil para saber que se presentó un problema en su sistema de aceite lubricante.

Es posible que el filtro dañado no se haya advertido hasta que se quitó durante el siguiente cambio de aceite programado. Sin embargo, si la presión fue suficiente como para romper la junta o desenrollar la costura engargolada, el dueño del automóvil habrá experimentado problemas inmediatos y costosos.

Con la "evidencia" en sus manos, tiende a echarle la culpa al filtro dañado. No es sorprendente que él esté un poco más que molesto cuando el fabricante del filtro niega cualquier responsabilidad por el daño. Entonces, ¿qué fue lo que causó la presión excesiva?. Echar una mirada a la forma como funciona el sistema de aceite lubricante, mostrará que la presión del aceite es creada por la bomba. El límite superior de ésta está controlado por una válvula reguladora de presión que generalmente es una parte integral de la bomba.

La figura 1 es un diagrama simplificado del sistema de aceite lubricante, que muestra bomba, válvula reguladora, filtro y rodamientos. La bomba suministra suficiente flujo para lubricar los rodamientos y otras partes móviles del motor. Este aceite debe estar bajo presión para separar adecuadamente las partes fuertemente cargadas del motor y evitar el desgaste excesivo. El objeto de la válvula reguladora es proporcionar esta presión, que en la mayoría de los automóviles de pasajeros se encuentra entre los 40 y 60 PSI (libras por pulgada cuadrada).

La válvula reguladora está formada por una bola o émbolo que regula la presión con la ayuda de un resorte. El resorte está calibrado de tal forma que el émbolo se levante de su asiento cuando la presión de aceite llega al nivel deseado. Una vez que la válvula está abierta, la presión permanece bastante constante con sólo cambios ligeros que se presentan cuando varía la velocidad del motor.

El filtro y los otros componentes en el sistema de lubricación están sujetos a la presión establecida por la válvula reguladora. Si esta presión es excesiva, se presentará el daño del filtro. Esto es lo que no comprenden las personas que no están familiarizadas con los sistemas de lubricación.

¿Qué es lo que puede hacer que la presión en el sistema exceda el ajuste de la válvula reguladora? La válvula puede estar pegada en la posición cerrada o está lenta para moverse a la posición abierta después de haber arrancado al motor. La figura 2 muestra el sistema funcionando con la válvula reguladora pegada en la posición de cierre. Bajo estas condiciones, la presión se acumula igualmente en todos los componentes en el sistema hasta que algo suceda para aliviar la presión.

Si la válvula reguladora se despeg, la presión regresará a normal. Si permanece pegada, algo se tiene que romper.

La presión de operación normal no origina deformación permanente en el cuerpo del filtro. Cuando la presión del sistema llega a 150 PSI debido a una válvula reguladora defectuosa, la mayoría de los filtros se deforman permanentemente. Bajo esta presión, la junta generalmente no se romperá y la costura engargolada permanecerá intacta.

Si la válvula reguladora continúa pegada, la presión se incrementará más y la junta entre el filtro y la base puede romperse. Esto probablemente hará que se pierda todo el aceite en el sistema. Si el filtro se ha instalado de manera demasiado apretada, la junta no se romperá y la costura engargolada se desenrollará conforme la presión continúa aumentando.

Si el cliente está alerta y para el motor a la primera indicación de problema (lámpara roja en o reducción en la presión de aceite) él puede limitar su pérdida a un trabajo de arrastre, cambio de aceite y filtro nuevo.

Si conduce hasta el taller más próximo, probablemente quemará el motor debido a la falta de aceite. El punto principal es que el filtro deformado no es la causa de esta presión excesiva, sino que es la víctima de una válvula reguladora defectuosa.

El cliente preguntará si un filtro que haya estado completamente tapado podría haber causado las condiciones de sobrepresión en el sistema. La respuesta es no.

Si la válvula reguladora está funcionando correctamente, mantendrá la presión en el filtro a 40 ó 60 PSI incluso si el filtro está tapado.

Resumiendo, si un filtro se deforma debido a sobre presión en el sistema, la falla reside en la válvula reguladora y no en el filtro.

Fig. 2

Filtros con soporte central o elemento colapsado.

COLAPSO:

Término usado para describir el daño ocasionado a un filtro en cuya apariencia se observa un aplastamiento del soporte central para el medio filtrante (figura 1).

Cuando encontramos un elemento filtrante donde ha ocurrido un colapso, la tendencia natural, es pensar que algo dentro del filtro no funcionó de manera correcta, siendo éste, el causante de los daños ocasionados. Generalmente ésta no es la causa de los daños, sino el síntoma de un problema dentro del motor.

Los motores automotrices incorporan una válvula check o válvula de alivio entre la entrada y salida del flujo total de aceite, esta válvula permite la continuidad de la lubricación creando un by-pass por donde el aceite circula sin pasar por el filtro directamente, dentro del motor cuando existe una restricción significativa en la presión de aceite, debido a la saturación del filtro o al arranque en frío (figura 2).

Generalmente los fabricantes de motores automotrices, han diseñado estas válvulas de alivio para abrir cuando la presión diferencial excede las 10 PSI, otros utilizan presiones de hasta por 30 PSI. Así algunos fabricantes de motores diseñan esta válvula integrada en el monoblock, mientras que otros prefieren que sea el filtro el que la lleve.

Los filtros automotrices han sido diseñados para soportar presiones significativamente superiores a la presión de operación normal de trabajo sin colapsarse, de ahí que cuando un filtro sufre un colapso, generalmente es el resultado de una obstrucción o de un mal funcionamiento de la válvula de alivio.

En ocasiones no es suficiente la obstrucción de la válvula para colapsar el filtro. La válvula reguladora de presión también puede obstruirse dando como resultado un incremento de presión en el flujo a través del filtro, aunque esta condición puede ser momentánea, rápidamente puede colapsarse el filtro si la válvula de alivio no puede liberar la presión excedente, debido al cambio repentino y por arriba de la presión de operación normal de trabajo.

Un filtro colapsado puede ocasionar la pérdida de la filtración y lubricación del motor; si esta condición se presenta, las válvulas reguladoras de presión y de alivio deberán ser inspeccionadas y reparadas o sustituidas por nuevas tan pronto como sea posible, previniendo que se presenten daños mayores.

El mal funcionamiento de la válvula de alivio, así como de la válvula reguladora de presión y el subsiguiente colapso del filtro, puede no causar daños notables en el motor, pero en ocasiones tiene resultados catastróficos, llegando a producir serios sobrecalentamientos e inclusive desvielmientos por falta de una lubricación.

Las causas frecuentes que producen el mal funcionamiento tanto de la válvula reguladora de presión, como de la válvula de alivio, pueden ser:

- 1.- Superficies pegajosas causadas por el arranque en frío o por el uso de aceites altamente viscosos.
- 2.- Aceites excesivamente contaminados asociados a la condensación, mezcla de refrigerantes y la oxidación del propio aceite.
- 3.- Descuido del usuario al prolongar los intervalos para el cambio de aceite y filtros recomendados por el fabricante.
- 4.- Residuos de carbón arenoso que temporalmente atascan el libre movimiento de los componentes de la válvula.
- 5.- Repentinos cambios de aceleración con la presencia de cualquiera de las condiciones arriba mencionadas.
- 6.- La combinación de cualquiera de las causas anteriores.

Descubrir un filtro colapsado, es un llamado para inspeccionar el estado de las válvulas de alivio y reguladora de presión en el motor, así como para revisar el funcionamiento del motor y la ejecución de los programas de mantenimiento.

GARANTÍA

GONHER DE MÉXICO, S.A. DE C.V., garantiza los filtros contra cualquier defecto de fabricación, durante el periodo de mantenimiento recomendado por los fabricantes del equipo en el cual se use filtros de la marca registrada **GONHER**.

En el caso de un daño al motor atribuible en forma directa a falla de un filtro **GONHER** que ha sido instalado en forma correcta, **GONHER DE MÉXICO** pagará la reparación a una condición equivalente a la que existía antes de la falla. El daño deberá ser comprobado por un técnico autorizado por **GONHER DE MÉXICO** antes de cualquier reparación.

GONHER DE MÉXICO no es responsable por cualquier otro daño o perjuicio.

Las garantías otorgadas por fabricantes de equipos nuevos permanecen vigentes cuando se instalen filtros **GONHER** y tendrá vigencia por los kilómetros u horas recomendados por los mismos.

Esta garantía podrá hacerse válida en **GONHER DE MÉXICO, S.A. DE C.V.**, cualquiera de los distribuidores autorizados o dirija un correo a stproducto@grupogonher.com

Gonher filters are guaranteed to be free from any defect in workmanship and materials during the service life recommended and if found to be defective will be replaced. Vehicle and engine warranties can not be voided solely due the use of **GONHER** filters.

In event of engines failure directly attributable to a **GONHER** filter defect, **GONHER** will restore engine to a condition equivalent to that existing just before the failure. However, **GONHER** is not liable for any other losses or expenses incurred due such defect.

GONHER DE MÉXICO, S.A. DE C.V.
